# Vinyl Soffit Returns

Vinyl soffit returns are vulnerable to animal intrusion from the day your home is built due to an inherent construction gap and vinyl flexibility. A raccoon was entering this return with ease.

Following animal removal, we exclude animal intrusion with a custom-fabricated steel flashing installed within the soffit return. From mice to raccoons, all animal intrusion is denied!

A completed soffit return exclusion has the vinyl soffit installed back over the exclusion work and thus invisible to the eye. Meticulous attention to craftsmanship and aesthetics are a top priority!

# Gable Vents

Following animal removal, we exclude animal intrusion with an exterior installation of steel welded wire, trimmed with custom-fabricated aluminum flashing. From mice to raccoons, all animal intrusion is denied, AND with style!

Before

Before

Full vent rebuild, painting and protection! Done once, done right!

After

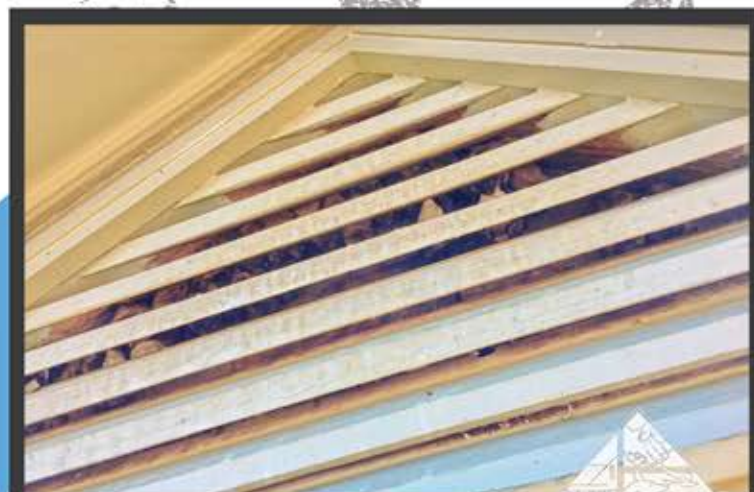

After

Meticulous attention is given to function AND aesthetics, ugly exclusion is unacceptable

Full vent replacement provided when damage is beyond repair.

Interior screening on gable vents, no matter the material strength, serves little purpose beyond creating a bat house as seen here (birds will still nest within the louvres as well). Properly excluded gable vents are screened and trimmed on their exterior to end ALL wildlife intrusion.

# Roof Vents

Weak screening under powered attic fan canopies are regularly damaged by raccoons, squirrels, and other species entering your attic.

We install XclusionPro XL® vent guards to permanently resolve.

Warping along ridge vents leave gaps vulnerable to bat, mouse, and other small animal entry.

We install black powder-coated steel Ridge Guard® to secure the ridge vent against animals.

Squirrels chew through a variety of static box roof vent styles as seen to left, and loose installations or build welds can leave these vents vulnerable to mice, bats, raccoons and everything in between.

We install XclusionPro® roof vent guards to protect static box roof vents.

Squirrels will chew lead plumbing vent flashings causing leaks. Rubber vent flashings (not pictured) can also be chewed through and will deteriorate in the sun and leak.

We install Quarrix ProBoot® steel pipe flashings to resolve and prevent both animal and water issues.

# Foundation Vents & Crawl Space Doors

This plastic foundation vent poses no obstacle to mice. We install premium XclusionPro® Foundation Vent Guards from AAC Distributing to both protect and maintain access to the vent slider.

Typical foundation vents allow mouse and other small animal intrusion with little to no effort, and damaged or missing vent bodies allow animals including opossums, raccoons, skunks and groundhogs an open door. HY-C Foundation Vent Guards provide a slim and impenetrable steel mesh barrier.

Some foundation vents require custom installations of welded wire or other materials when prefabricated vent guards cannot be installed.

Builder-basic crawl doors, wood-constructed doors, or other closure attempts are often laughably weak at preventing animal intrusion and fail in protecting the underside of your home which houses components like expensive HVAC systems and more. We install custom-fabricated and premium-grade Crawlbrella® Insulated Crawl Doors as above. We also install Crawlbrella® area well covers as pictured to left.

# Bathroom and Dryer Vents

House Sparrows and European Starlings exploit unprotected exhaust vents for nesting.

Birds nesting within exhaust vents often damages the flexible ducts and may lead to birds free within your attic or wall/ceiling spaces and a mess of droppings and nesting debris..

We stop bird entry at bathroom exhaust vents with inconspicuously installed steel welded wire rather than unattractive cages.

With the vent louvres re-installed birds are kept out and your home's aesthetic is maintained.

Bird nesting in dryer vents causes inefficient clothes drying as moisture can't escape, damaged heating elements in your dryer, and a risk of house fire.

Caging or screening a dryer vent is equally hazardous as it will trap lint and block the vent over time. Therefore, we install premium bird-resistant dryer vents that rely on mechanical design features to keep birds out and flow unrestricted when in operation.

# Small Animal Exclusion

The open bases of siding corners say "c'mon in" to small animals, and we install both pre-fab and custom base caps to end this.

Unsealed utility chases are an open door for mice, snakes, and more.

Damaged or short bottom seals on your garage allow mouse intrusion; we replace these and other seals, and have options for additional door sweep protection.

Construction gaps at the junction between fascia boards and masonry are common and vulnerable to bat, mouse, and even bird and squirrel intrusion at times. We use professional-grade sealants, and flashings, to close this gap and improve your home's aesthetics.

# Custom Exclusions

Bird roosts on storefront signage results in significant accumulations of unsightly and damaging fecal debris. Post-cleanup we fabricated and installed a custom bird slide to stop bird roosting permanently.

Squirrels and sawzalls can both make big holes on your home. Following animal removal we provide an exclusion repair above and beyond typical construction and steel clad the vulnerable areas. Impenetrable to future wildlife intrusion and once painted uncompromising aesthetics!

Birds have a frustrating habit of nesting on porch column ledges. We fabricate and install custom bird slides to stop bird roosting and nesting behaviors.

Common construction gaps on many residential and commercial buildings are sufficiently large to allow bat, mice, snake, and other small animal entry with little to no effort. Custom flashing installations are one method we use to close gaps with aesthetics in mind.

# Chimney Covers

Wide open chimney flues are vulnerable to animal and water intrusion. We install professional-grade chimney covers in multi-flue and single flue configurations. We also apply Chimney RX Crown Repair and masonry sealants to protect and maintain your chimney.

Galvanized steel chase covers on many modern gas flue systems rust and stain. Custom stainless steel chase covers are the solution we provide.

We provide the premium option of fully custom chimney cover fabrication in stainless steel or copper!

The unprotected insulating flue walls on galvanized flue liners are regularly entered by small birds which often cannot be removed. We install additional screens to safely eliminate this issue.

Screens should never be installed flush to a flue top like this, code was violated and a raccoon still defeated. We'll properly install stainless steel chimney spark arrestor material at the masonry openings for a safe, proper, and long-term solution.

# Insulation & Attic Restoration

Like it Never Happened!

Whether you need a full restoration or just adding insulation in areas of insufficiency we have you covered!

# Dig Barriers & More!

Sheds, decks, home foundations, and more, all suffer from animals sheltering or burrowing under them. We trench, we fence, and we stop animal intrusion in its tracks with steel welded wire dig barriers.

Completed dig barriers are inobtrusive and ready for fresh landscaping of your choice!

16 GAUGE, GAW 1/2"X1/2" STEEL WELDED WIRE, BLACK VINYL COATED

...And Much More!

- Gutters, gutter guards, and gutter cleaning
- Vinyl soffit and siding repair
- Trim flashing
- Roof repair
- Just ask about more, we may be able to help!
